GOALS

In this course the student will:

- Define and apply the properties of limits of functions.
- State the definition of continuity and determine where a function is continuous or discontinuous.
- Find the derivative of an algebraic function by using the definition of a derivative.
- Apply differentiation rules to find the derivative of algebraic, trigonometric, exponential, and logarithmic functions and their inverses.
- Apply differentiation rules to find the derivative of the sum, product, quotient, inverse, and composite (chain rule) of elementary functions.

- Find the derivative of an implicitly defined function.
- Find the higher order derivatives of algebraic, trigonometric, exponential, and logarithmic functions.
- Use logarithmic differentiation as a technique to differentiate non-logarithmic functions.
- State and prove the Mean Value Theorem for derivatives and apply it algebraically and graphically.
- Use the derivative to find critical numbers, increasing intervals, decreasing intervals, local extrema, absolute extrema, concavity intervals and inflection points.
- Apply the derivative to solve problems, including tangent and normal lines to a curve, curve sketching, velocity, acceleration, related rates of change, and optimization problems.
- Define natural logarithmic function, natural exponential function, general logarithmic and exponential functions, also find its derivative and use the logarithms to find the derivative of complicated functions.
